Amendments to the Claims:

This listing of claims will replace all prior versions, and listings, of claims in the application:

- 1. (Currently Amended) A process for preparing boehmitic aluminas by hydrolysis of aluminium alcoholates in aqueous, alkaline solution forming a mixture, optionally followed by hydrothermal aging, characterised in that
 - the hydrolysis is carried out at pH values above 9.5 and the hydrolysis and/or the hydrothermal aging of the mixture resulting from the hydrolysis is carried out in the presence of 0.1 to 0.5 wt.% of carboxylic acids having at least one additional substituent, the salts thereof or their derivatives which during hydrolysis and/or the hydrothermal aging are at least partially converted into the free carboxylic acid or the dissociated form thereof, wherein said at least one additional substituent is selected from the group consisting of earboxy, hydroxy-, oxo- and amino groups; and
 - (B) the boehmitic aluminas prepared in step (A) are subjected to an aging step at 120°C to 250°C for at least 1 hour.
- 2. **(Previously Presented)** The process according to claim 1, characterised in that the substituted carboxylic acid, their derivatives or the salt thereof is added in quantities of 0.2 to 0.4 wt.%, referring to the total mass of the premix composition and calculated as substituted carboxylic acid.

Amendment Dated: January 26, 2009

Reply to Office Action of November 25, 2008

3. (Currently Amended) The process according to any one of claims 1 or 2, characterised in that the substituted carboxylic acid, their derivatives or salt thereof are selected from the group consisting comprised of di or tricarboxylic acids, hydroxycarboxylic acids, hydroxydicarboxylic acids, hydroxydicarboxylic acids, dihydroxydicarboxylic acids, oxocarboxylic acids, amino acids and mixtures thereof.

4. (**Previously Presented**) The process according to any one of claims 1 or 2, characterised in that the hydrolysis is carried out at 50 to 95°C, preferably above 60 to 95°C.

5. (Cancelled)

- 6. (**Previously Presented**) The process according to any one of claims 1 or 2, characterised in that the aging step in (B) is carried out at temperatures ranging from 130°C to 220°C, preferably 205°C to 215°C for at least 1 hour, preferably at least 2 hours.
- 7. **(Previously Presented)** The process according to claim 6, characterised in that the aging step in step (B) is carried out in an aqueous environment with a solid matter concentration (calculated as Al₂O₃) at the beginning of the aging step ranging from 2 to 17 wt.%, preferably 5 to 10 wt.%, referring to the total mass of composition subjected to aging.

Amendment Dated: January 26, 2009

Reply to Office Action of November 25, 2008

8. (Previously Presented) Boehmitic aluminas manufactured by the process

according to any one of claims 1 or 2, and which convert to the α -phase only at

temperatures of above 1350°C.

9. (**Original**) The boehmitic aluminas according to claim 8, characterised in that the

aluminas have a lamellar (plate type) or needle shaped (acicular) crystal structure,

preferably an acicular one, depending on the carboxylic acid used.

10. (Previously Presented) The boehmitic aluminas according to claim 8 or the

alumina prepared therefrom by calcination, characterised in that before and after

calcination the boehmitic aluminas or the alumina are dispersible even at neutral

pH values in aqueous or organic media, particularly C₁- to C₃-alcohols, in

quantities above 1 wt.%, preferably above 7 wt.%, most preferably above 10

wt.%, calculated as Al₂O₃ and referring to the total composition.

11. (Previously Presented) An alumina prepared according to any one of claims 1 or

2 followed by calcination, characterised in that the alumina when treated with

temperatures of above 1200°C remains to have a pore volume of above 0.5 ml/g,

based on pore radii from 2 to 100 nm, and a surface area above 20 m²/g, measured

in accordance with DIN 66131.

4

Reply to Office Action of November 25, 2008

12. (**Previously Presented**) An alumina prepared according to any one of claims 1 or

2 followed by calcination, characterised in that calcination is carried out at above

450°C and the alumina has a particle size ranging from 10 to 50 nm in aqueous

suspension or dispersion.

13. (Cancelled)

14. (Previously Presented) A catalyst carrier for preparing compositions used in

motor car catalytic converters comprising a boehmitic alumina according to any

one of claims 1 or 2.

15. (Currently Amended) A process for preparing boehmitic aluminas by hydrolysis

of aluminium alcoholates in aqueous, alkaline solution forming a mixture,

optionally followed by hydrothermal aging, characterised in that

(A) the hydrolysis is carried out by mixing the aluminum alcoholate with an

aqueous alkaline premix containing a pH adjuster to provide a hydrolysis

mixture and hydrolyzing the aluminum alcoholate in the hydrolysis

mixture at pH values above 9 and at a temperature of 50 to 95°C and

the hydrolysis and/or the hydrothermal aging of the mixture resulting from

the hydrolysis is carried out in the presence of 0.1 to 0.5 wt.% of

carboxylic acids having at least one additional substituted, the salts thereof

or their derivatives which during hydrolysis and/or the hydrothermal aging

are at least partially converted into the free carboxylic acid or the

dissociated form thereof, wherein said at least one additional substituent is selected from the group consisting of carboxy, hydroxy-, oxo- and amino groups; and

- (B) the boehmitic aluminas prepared in step (A) are subjected to an aging step at 120°C to 250°C for at least 1 hour.
- 16. (**Previously Presented**) A process for preparing boehmitic aluminas by hydrolysis of aluminium alcoholates in aqueous, alkaline solution forming a mixture, optionally followed by hydrothermal aging, characterised in that
 - the hydrolysis is carried out at pH values above 9.5 and the hydrolysis and/or the hydrothermal aging of the mixture resulting from the hydrolysis is carried out in the presence of 0.1 to 0.5 wt.% of carboxylic acids having an amino group, the salts thereof or their derivatives which during hydrolysis and/or the hydrothermal aging are at least partially converted into the free carboxylic acid or the dissociated form thereof; and
 - (B) the boehmitic aluminas prepared in step (A) are subjected to an aging step at 120°C to 250°C for at least 1 hour.
- 17. (**Previously Presented**) The method of claim 1 wherein the hydrolysis is carried out by mixing the aluminum alcoholate with an aqueous alkaline premix containing a pH adjuster to provide a hydrolysis mixture and thereafter hydrolyzing the aluminum alcoholate in the hydrolysis mixture.
